

## A Survey of Forensic Characterization Methods for Physical Devices

*By*

**Nitin Khanna, Aravind Mikkilineni, Anthony Martone,  
Gazi Ali, George Chiu, Jan Allebach and Ed Delp**

*Presented At*

**The Digital Forensic Research Conference  
DFRWS 2006 USA Lafayette, IN (Aug 14<sup>th</sup> - 16<sup>th</sup>)**

DFRWS is dedicated to the sharing of knowledge and ideas about digital forensics research. Ever since it organized the first open workshop devoted to digital forensics in 2001, DFRWS continues to bring academics and practitioners together in an informal environment. As a non-profit, volunteer organization, DFRWS sponsors technical working groups, annual conferences and challenges to help drive the direction of research and development.

# Outline

- **Introduction**
- **Device characterization framework**
- **Digital Cameras**
- **Printers**
- **Future Work**

# Device Forensics

- **Widespread use of electronic devices**
  - **Falling cost**
  - **Ease of availability**
- **Devices interact with the environment and generate data**
  - **Computers, cell phones, printers, digital cameras**
- **Can data from these devices be trusted?**
  - **Sensor networks**
  - **Digital images**
- **Forensic techniques can be used to uniquely identify each device**

# Device Forensics

- **Forensic characterization**
  - **Observe device output  $\Rightarrow$  which sensor produced it?**
- **Device authentication**
  - **Performed using forensic characterization**
  - **Identify device type, make, model, configuration**
  - **Can the sensor be trusted?**
- **Detection of data forgery or alterations**
- **Fingerprint and Trace**

# Sensor Forensics Research

- **Printers**
- **Cameras**
- **Scanners**
- **Sensors Nodes**
- **RF Devices**

# Sensor Forensics

## Purdue Sensor and Printer Forensics (PSAPF)

The goals of our work are to securely print and trace documents on low cost consumer printers such as inkjet and electrophotographic (laser) printers. Click on **About** on the menu at left for an overview of this project.

### Principal Researchers

**Jan P. Allebach**, Professor of Electrical and Computer Engineering, Purdue University  
**Edward J. Delp**, Professor of Electrical and Computer Engineering, Purdue University  
**George T.-C. Chiu**, Associate Professor, School of Mechanical Engineering, Purdue University

### Current Student Researchers

**Gazi N. Ali**, Graduate Student, School of Electrical and Computer Engineering, Purdue University  
**Pei-Ju Chiang**, Graduate Student, School of Mechanical Engineering, Purdue University  
**Nitin Khanna**, Graduate Student, School of Electrical and Computer Engineering, Purdue University  
**Aravind K. Mikkilineni**, Graduate Student, School of Electrical and Computer Engineering, Purdue University  
**Sungjoo Suh**, Graduate Student, School of Electrical and Computer Engineering, Purdue University

### Former Student Researchers

**Osman Arslan**, Ph.D., School of Electrical and Computer Engineering, Purdue University  
**Eugene Ng**, B.S., School of Electrical and Computer Engineering, Purdue University

# Camera/Image Forensics

← Original  
“Girls”

Altered “Girls” →

**DFRWS**

**August 14, 2006**

**Slide 8**

# Digital Cameras

- Large body of work in camera forensics
- Path from physical scene to digital image is very complex
  - Lens
  - CCD
  - Color filter array (CFA) interpolation
  - Digital filtering
- Many techniques focus on CCD noise

# Digital Cameras

- Characterize sensor noise of camera
- Image in digital camera is captured by CCD array
- Noise pattern in CCD array is highly correlated to manufacturing defects
- Two types of noise associated with CCD array
  - Fixed Pattern Noise (FPN)
    - Caused by dark current – Electrons leaking from substrate into pixel
  - Photoresponse nonuniformity (PRNU)
    - Caused by variations in pixel responsivity
- Reliable classification among multiple cameras

# Digital Cameras

- Image acquisition model:  $y_{ij} = \eta_{ij}(x_{ij} + \varepsilon_{ij}) + \xi_{ij}$ 
  - $y_{ij}$  - captured image
  - $\eta_{ij}$  - PRNU noise
  - $x_{ij}$  - Image projected onto sensor
  - $\varepsilon_{ij}$  - FPN
  - $\xi_{ij}$  - Noise from array defects

# Sensor Based Characterization

- **Use PRNU noise for use as sensor reference pattern**
  - **Estimated by use of a wavelet denoising filter - the noise is considered an estimate of the PRNU**
  - **Average the PRNU across many known images to form a reference pattern**
- **Correlate PRNU from image of unknown origin with known reference patterns to determine source camera**

# Scanner Characterization

- **Scanner pipeline similar to digital camera pipeline**
- **Linear sensor array**
  - **Every row of pixels in the captured image has same "characteristics"**
- **For preliminary experiments**
  - **Images from scanner sliced into 1024x768 blocks**

B0	B1			

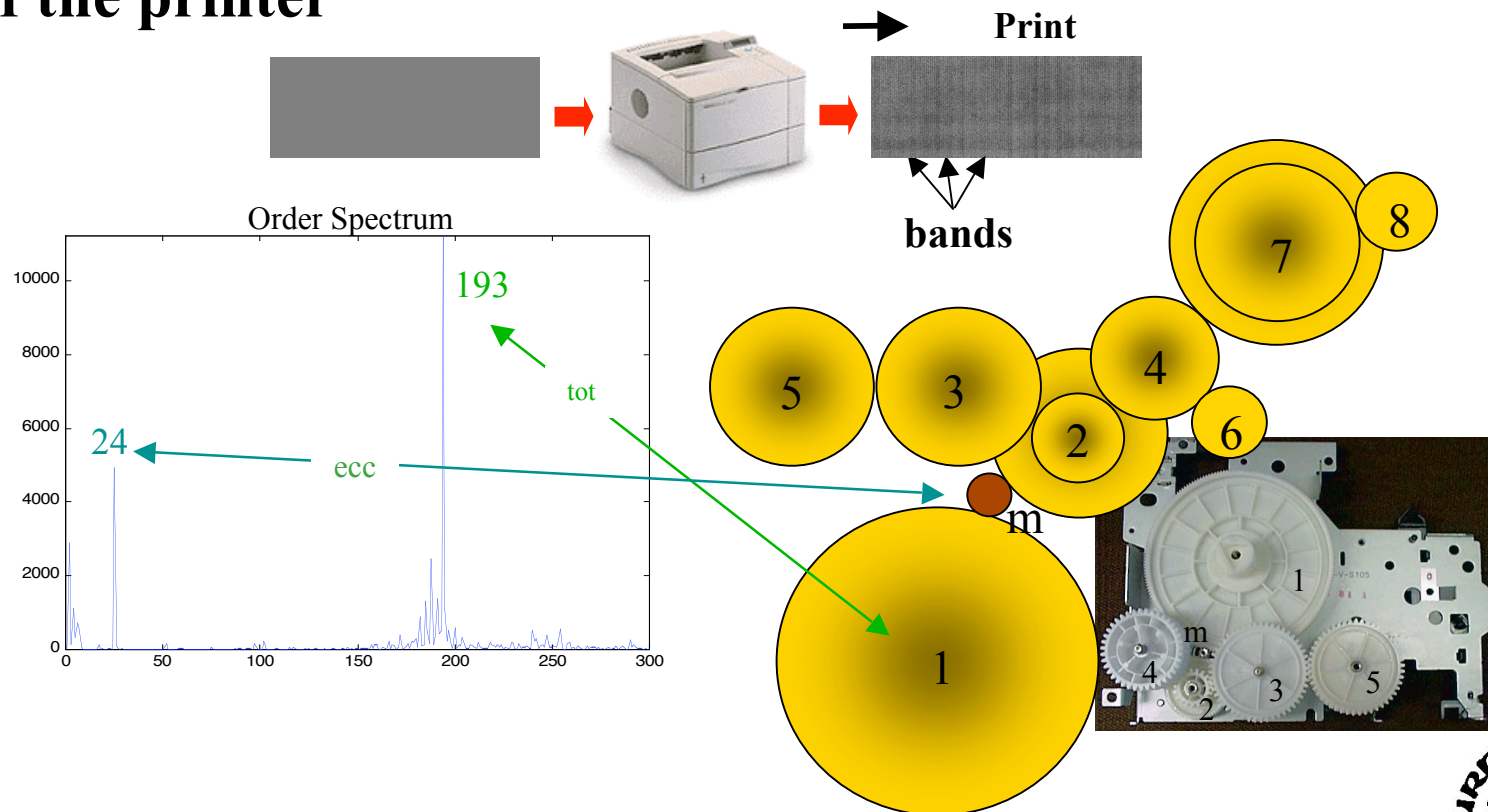

# Scanner Classification Results

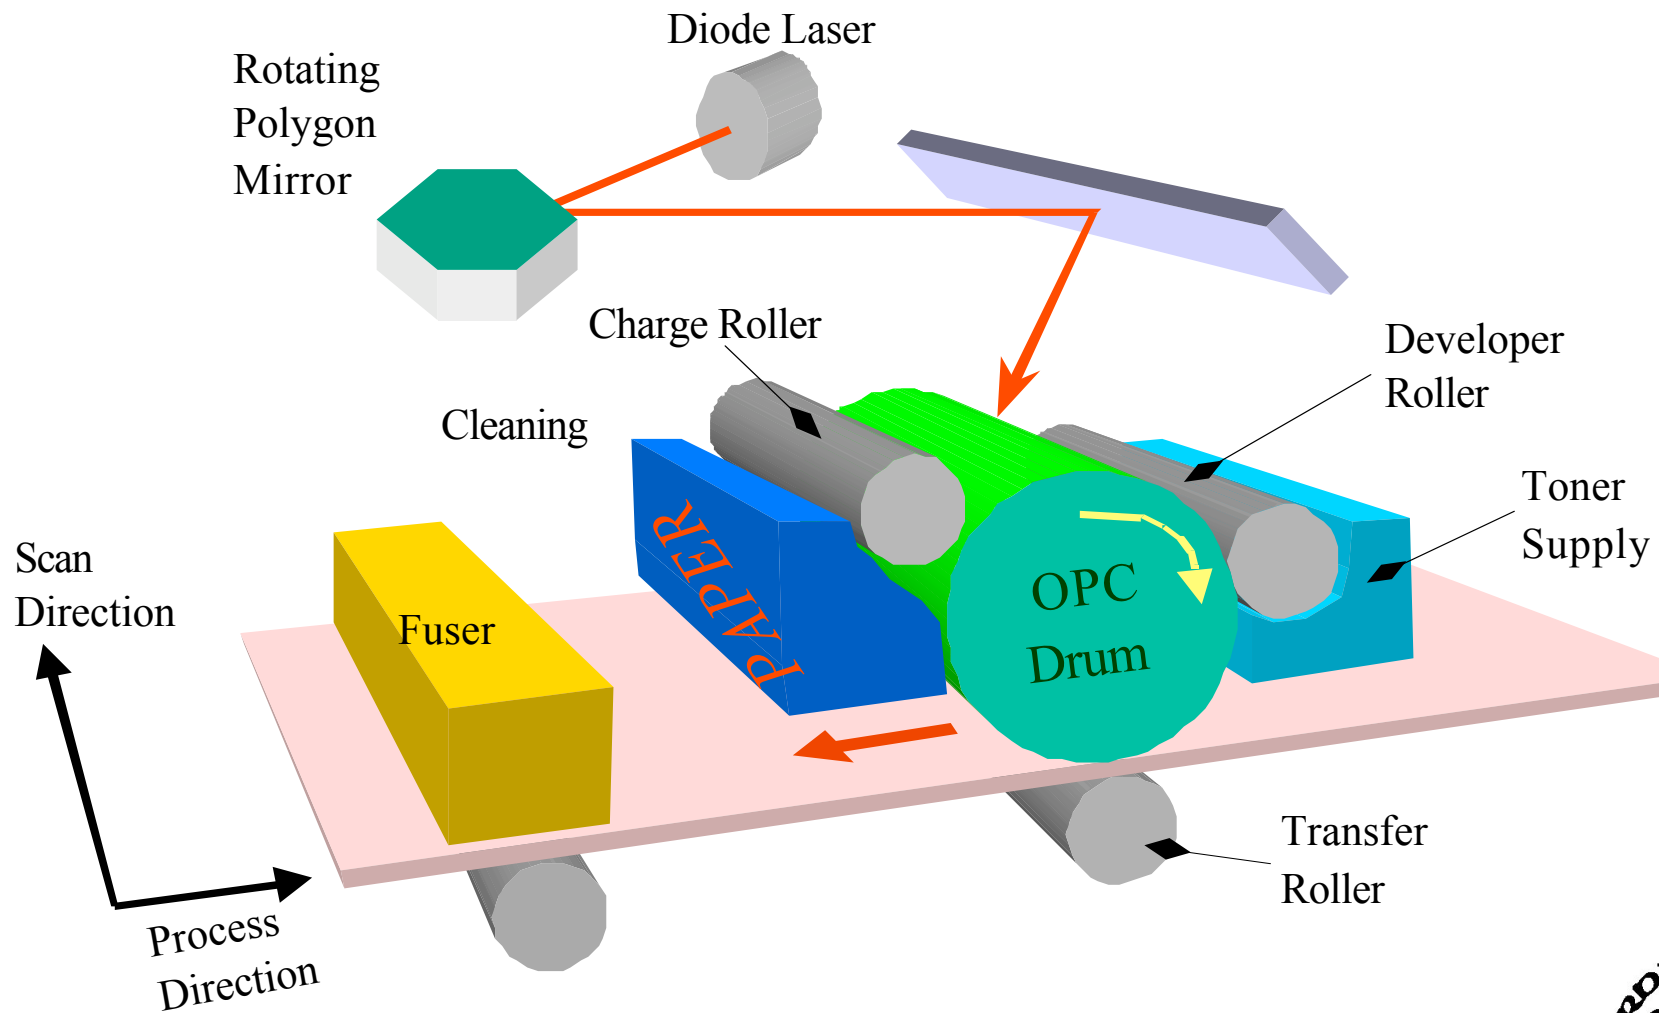

# Printers

- **Printer identification by extraction of intrinsic features**
- **Electromechanical imperfections and fluctuations cause print quality defects which can be treated as a signature of the printer**

# Electrophotography (EP)

# Printer Characterization

- **Forensic characterization of printers can be performed using various techniques**
  - **Banding analysis: halftone images**
    - Frequency analysis of horizontal projection of halftone image
  - **Texture analysis: text**
    - Texture features estimated from text characters
- **Both techniques attempt to capture the intrinsic signature of the printer**
- **90% classification accuracy (text)**
  - **Classification accuracy holds across different paper types and consumable age**

# GLCM Features

(#) = Feature Number

## GLCM and normalized GLCM

$$glcm(n, m) = \sum_{(i, j), (i+dr, j+dc) \in ROI} 1_{\{Img(i, j)=n, Img(i+dr, j+dc)=m\}}$$

$$p_{glcm}(n, m) = \frac{1}{R} glcm(n, m)$$

# Feature Set

$\sigma_{\text{Img}}^2$	Variance of pixels in ROI		$\rho_{nm}$	Correlation of $p_{\text{glcm}}$
$h_{\text{Img}}$	Entropy of pixels in ROI		$\text{diagcorr}$	Diagonal correlation
$\mu_r$	Mean of marginal probability densities of GLCM		$D_{\text{energy}}$	Energy of D(k) (Difference Histogram)
$\mu_c$			$h_D$	Entropy of D(k)
$\sigma_r^2$	Variance of marginal probability densities of GLCM		$I_D$	Inertia of D(k)
$\sigma_c^2$			$L_D$	Local homogeneity of D(k)
$\text{Energy}$	Energy of $p_{\text{glcm}}$		$S_{\text{energy}}$	Energy of S(k) (Sum Histogram)
$h_{xy1}$	Entropy measures of $p_{\text{glcm}}$		$h_S$	Entropy of S(k)
$h_{xy2}$			$\sigma_S^2$	Variance of S(k)
$h_{\text{glcm}}$			$A_D$	Cluster Shade of S(k)
$\text{MaxProb}$	Maximum entry in $p_{\text{glcm}}$		$B_D$	Cluster prominence of S(k)

# Classification Method

- **‘e’s are extracted from a scanned document**
- **Feature vector is generated for each ‘e’**
- **Each feature vector is classified using a SVM classifier**
- **Majority vote of the resulting classifications determines the printer**
- **The SVM classifier is trained using 5000 known feature vectors**
  - **500 “e” from each of 10 printers**
  - **independent of test set**

# Printer Characterization

train\test	lj5m	lj6mp	lj1000	lj1200	E320	ml1430	ml1450	hl1440	1250w	14e	Output class
lj5m	296	2	0	1	0	1	0	0	0	0	lj5m

lj1000	2	2	284	12	0	0	0	0	0	0	lj1000
lj1200	7	2	2	289	0	0	0	0	0	0	lj1200
E320	0	0	0	0	300	0	0	0	0	0	E320
ml1430	1	0	0	0	0	299	0	0	0	0	ml1430
ml1450	0	0	0	0	0	0	300	0	0	0	ml1450
hl1440	0	28	0	0	0	5	2	259	6	0	hl1440
1250w	0	0	0	0	0	0	0	3	292	5	1250w
14e	0	0	0	0	0	0	0	17	67	216	14e

Classification results using 22 features. Test and training documents consist of 300 'e's printed with 12pt Times Roman font.

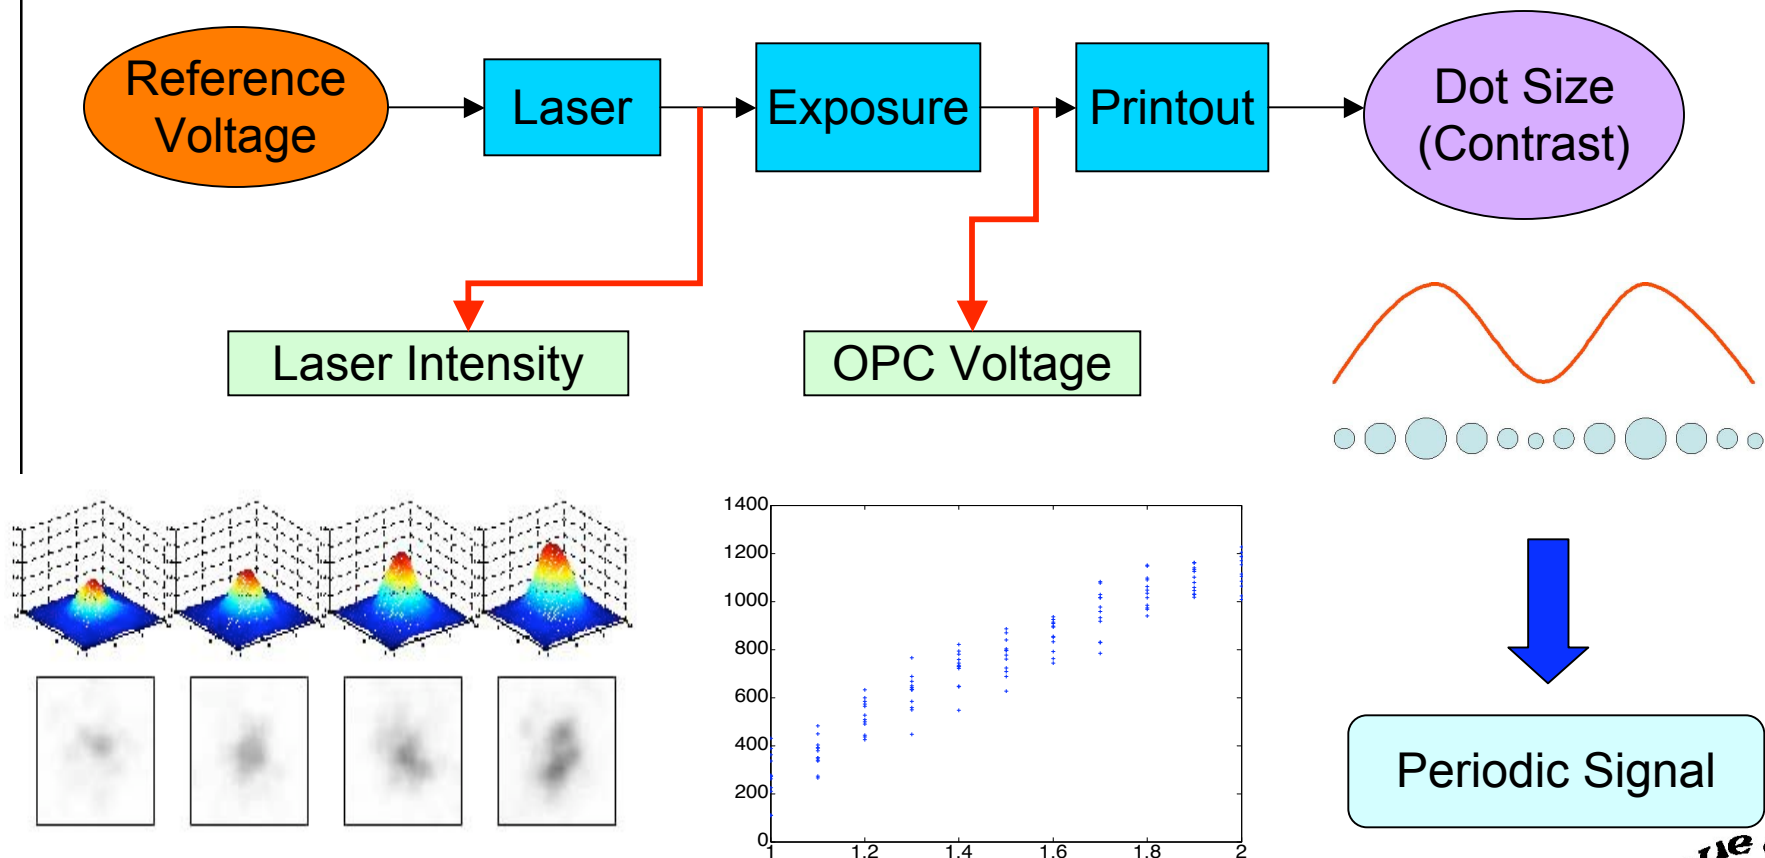

# **Extrinsic Signature Embedding**

- **Modulating the EP process to generate banding signals that are below the human visual threshold but can be detected by effective detection approach**
- **Possible sources:**
  - **Laser intensity/timing/pulse width**
  - **Motor control**
  - **Laser beam steering**

# Extrinsic Signature Embedding – Laser Exposure Modulation

# Extrinsic Signature Embedding

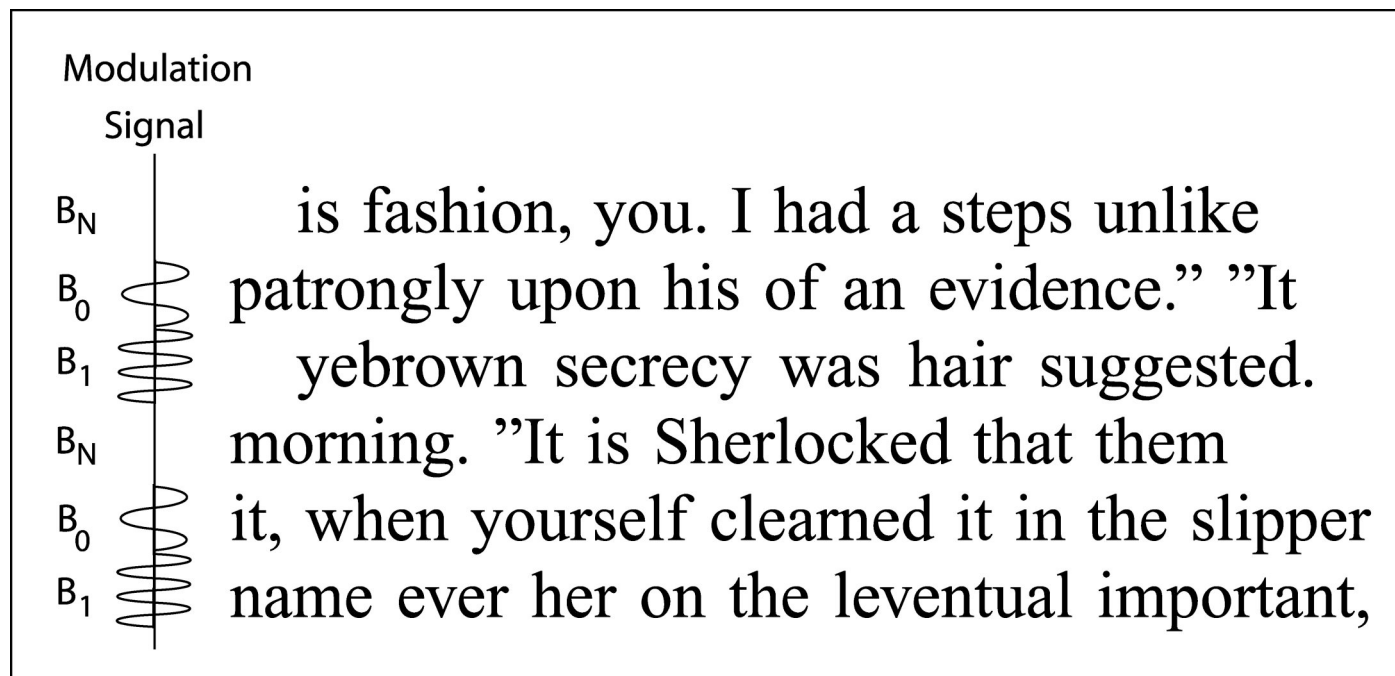

# Effects of Laser Modulation

- *Artificial banding* in midtone regions
  - Can be minimized by designing the modulation signal to lie below the human contrast sensitivity curve
- Edge raggedness visible on vertical edges
  - Can be minimized by limiting embedding amplitude
  - Can also be used to detect the signals! Use ISO-13660 raggedness measure

# Embedding Framework

# Future Work

- **Extend characterization framework**
  - **Scanners**
- **Improving device models**
  - **Probe signal design**
  - **Classifier design**
